 CTD _{O₂} Graphical and Tabular Data	 15

Abstract

This report summarizes in graphical and tabular form the continuous conductivity-temperature-pressure-dissolved-oxygen (CTDO₂) data collected during the R/V ATLANTIS II Cruise 107, Leg X. These data were collected in the austral winter of 1980 as part of the International Southern Ocean Studies (ISOS) to evaluate and test various Antarctic Intermediate Water formation and circulation mechanisms.

1. INTRODUCTION

Continuous conductivity-temperature-pressure and dissolved-oxygen (CTDO₂) data from the southwestern Argentine Basin, northwestern Scotia Sea, and northern Drake Passage collected during the R/V ATLANTIS II Cruise 107, Leg X, are summarized in graphical and tabular form. These data were collected as a part of an austral winter hydrographic program for the International Southern Ocean Studies (ISOS) designed to evaluate various Antarctic Intermediate Water formation and circulation schemes (McCartney, 1977; Georgi, 1979; Molinelli, 1981). A discussion of the scientific goals has been given by Georgi and Piola (1981).

The R/V ATLANTIS II sailed from Mar del Plata, Argentina, August 5, and debarked after 33 days at sea in Punta Arenas, Chile, September 6, 1980. During the cruise, 99 CTDO₂ profiles were made (Figure 1) with one of two WHOI/Brown CTDO₂ profilers (Brown and Morrison, 1978). On most stations, profiles were made to within a few meters of the sea-floor, and up to 24 water samples were collected. These water samples provided the primary calibration data for the CTDO₂ conductivities (i.e., salinities) and dissolved-oxygen. In addition, the water sample data were analyzed for nutrient concentrations by members of Dr. L. Gordon's chemistry group of Oregon State University. The tabulated data from the 1500 water samples will be published in a separate volume. Water samples were also collected for tritium and helium-tritium analysis by Dr. W. Jenkins of Woods Hole Oceanographic Institution.

Along the 3972 nautical miles of track, between CTDO₂ stations, nearly 300 expendable bathythermographs (XBT) were collected, which will be reported with the water sample data.

2. CTDO₂ DATA COLLECTION AND PROCESSING METHODS

The CTDO₂ data were collected with two WHOI/Brown CTDO₂ systems referred to as CTD#3 and CTD#8. For stations 150-167 and 179-183, CTD#3

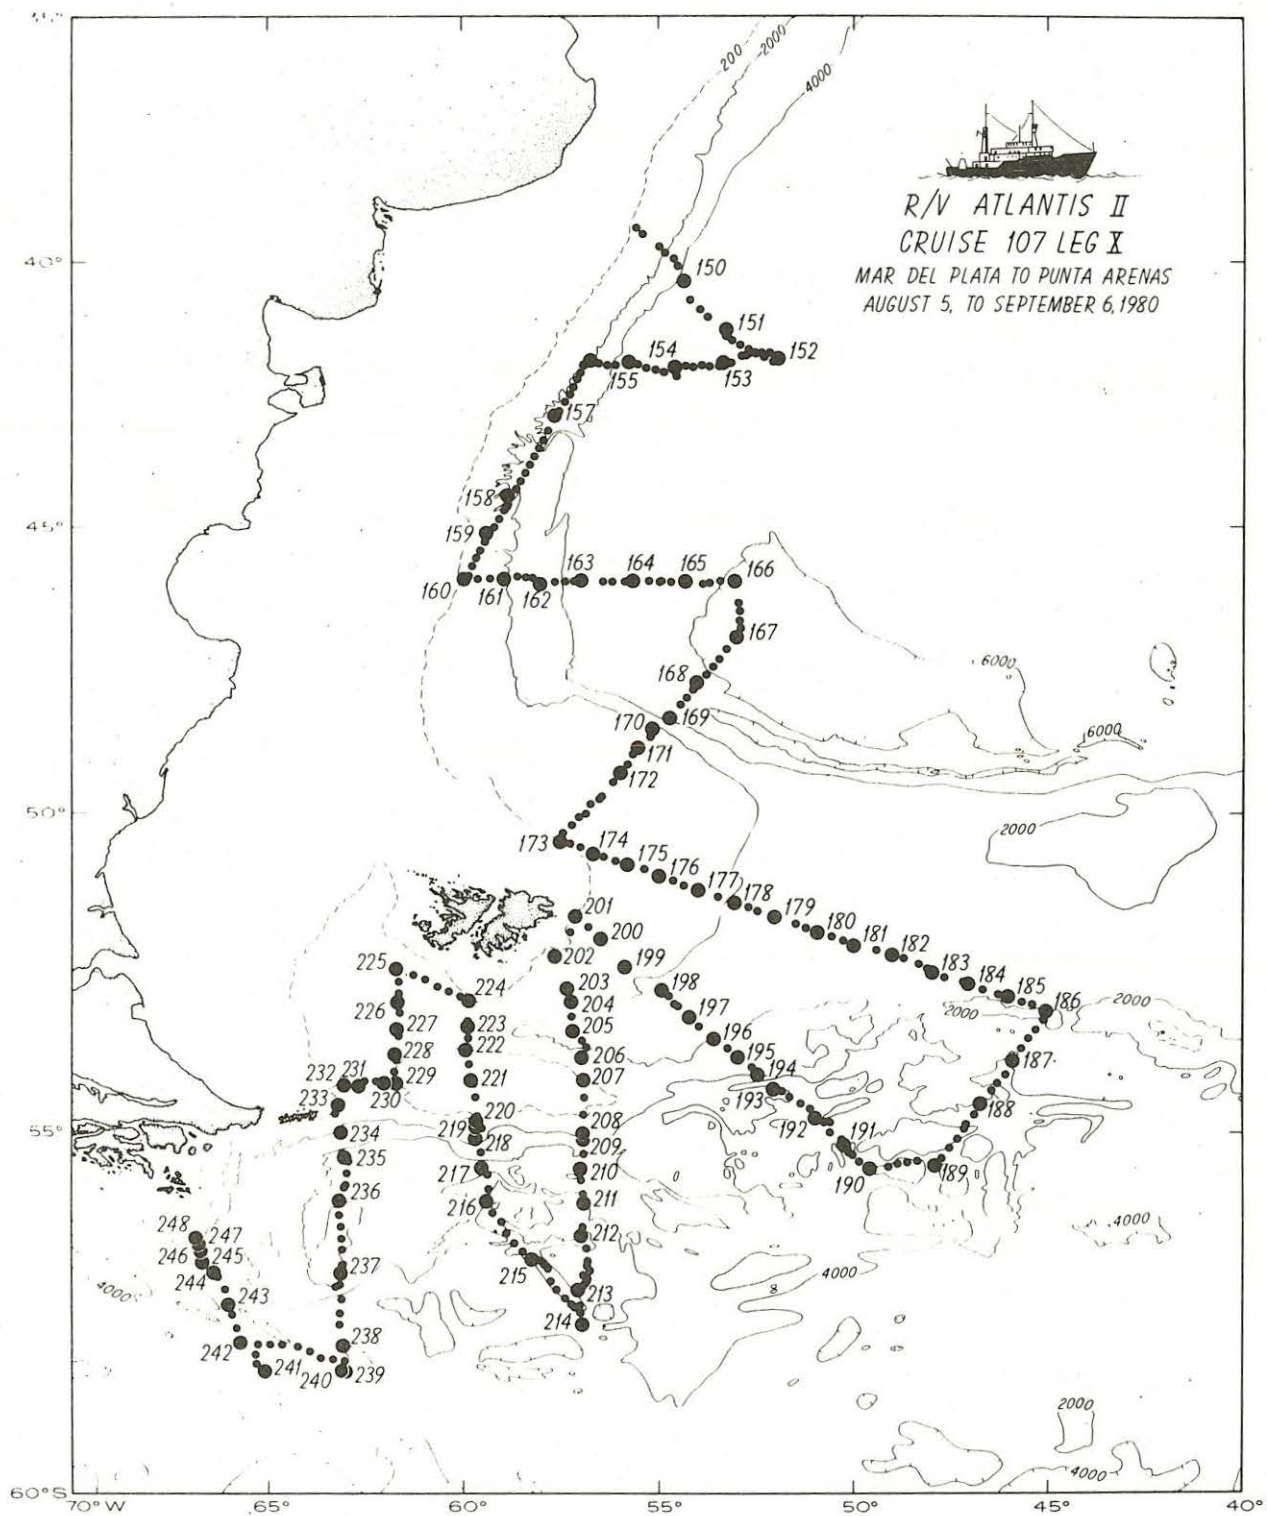

Figure 1: CTDO₂ and XBT station positions.

with a separate fast-response temperature sensor was used. For the remaining stations, CTD#8 with only a standard platinum thermometer was used. Both CTD₂ systems were equipped with a Beckman dissolved oxygen probe. To calibrate the CTD₂ salinities and dissolved-oxygens, a surface-activated water sampler, rosette, with 24 1.2-liter sample bottles was used (General Oceanics, Inc.). Generally, 1 to 3 thermometric temperatures and pressures were obtained on each station. However, as the pre- and post-cruise laboratory calibrations were consistent to millidegrees and decibars, the thermometric data were not used for CTD₂ calibration. However, the data were useful for sorting out rosette malfunctions.

During the cruise, two Hewlett-Packard mini-computers were used for CTD₂ data acquisition and editing. The post-cruise calibration and data processing were carried out on the WHOI VAX-11/70 computer system.

Shipboard salinity determinations were done with a Guildline Autosol 8400 salinometer which was standardized with Wormley Standard Water. Standardization was generally performed once per session or every 24 water samples. The salinometer calibration was found to drift less than .002‰ between standardizations and no drift corrections were applied to samples run between standardizations.

Dissolved oxygen determinations were made on 50 ml samples with a modified Winkler method. Repeated titrations indicate an accuracy of .05 ml/l.

Salinities were computed from the CTD₂ data with an algorithm similar to that described by Fofonoff et al. (1974), but updated (Millard, 1981) to use the 1978 practical salinity scale (Lewis, 1980). To calibrate CTD₂-derived salinities, the water sample salinities were inverted to obtain in situ conductivities and conductivity differences (rosette-CTD₂). These differences were analyzed using standard linear regression techniques. By adjusting the multiplicative constant, conductivity slope, used to

scale the CTD_{O₂} conductivities, CTD#8 conductivity differences were reduced to $0 \pm .003$ mmhos (Figure 2). The conductivity data from CTD#3 was somewhat more problematic, probably due to a failing conductivity cell. To calibrate CTD#3 conductivities, it was necessary to employ a pressure-dependent correction (equivalent salinity magnitude of $.04\text{‰}$). This correction was applied in the upper 1000 m, in addition to the standard multiplicative factor (Figure 3). Due to the erratic nature of the conductivity error, we believe that there may still be pressure-dependent errors as large as $.01\text{‰}$ in the CTD#3 salinities from the upper 1000 m. The accuracies of the deep water salinities are similar to those attained with CTD#8.

CTD_{O₂} dissolved oxygens were calculated with the following algorithm:

$$O_2 = O_2\text{Sat}(T,S) \cdot (O_c \cdot A + B) e^{(T_{\text{cor}} \cdot T_w + P \cdot P_{\text{cor}} + T \cdot P \cdot TP_{\text{cor}})}$$

where O_2 : dissolved-oxygen [ml/l]
 T, S, P : the CTD_{O₂} temperature, salinity and pressure
 $O_2\text{Sat}$: oxygen saturation [ml/l] (Weiss, 1970)
 O_c : CTD_{O₂} oxygen current
 A, B : sensitivity and bias
 T_{cor} : temperature constant
 P_{cor} : pressure constant
 TP_{cor} : cross-term for temperature and pressure
 T_w : average of the CTD temperature and the oxygen probe temperature

Generally, CTD_{O₂} dissolved-oxygens exhibit a hysteresis of $0(.1 \text{ ml/l})$ between down and up profile data. The source of this hysteresis is not well understood, but it is believed to be related to the behavior of the Teflon membrane used on the oxygen sensor. As the CTD_{O₂} data of primary interest are collected during the descent portion of the station and the bottle data during the ascent, the CTD_{O₂} and bottle dissolved-oxygens cannot be directly compared. To overcome this problem, density computed from the CTD_{O₂} temperature and salinity data collected on the ascent were used

CONDUCTIVITY RESIDUALS

Figure 2: CTD#8 conductivity residuals. The standard deviation for the 1005 samples is .0028 mmho.

Figure 3: Shown on the left are the precalibration rosette - CTD02 conductivity differences for Stations 151 to 155. On the right are shown the post-calibration differences.

to find the corresponding density on the descent data. In this manner, we obtained a CTDO₂ data set from the descent mode, which could be compared directly with the bottle data.

If the above equation is divided by the dissolved-oxygen saturation, O₂Sat, the bias B neglected, and the logarithms taken, then standard linear regression techniques can be used to determine the constants, T_{cor}, P_{cor}, TP_{cor}, and A. With this procedure we were able to calibrate the CTDO₂ dissolved oxygens with a residual error of 2 percent, [0(.1 ml/l), Figures 4 and 5]. From visual inspection it was apparent that the CTDO₂ dissolved-oxygen data on some stations differed systematically from the bottle data. Thus, additional constant corrections, .15 ml/l and less but typically, 0(.05 ml/l), were applied to individual stations. On some stations (e.g., 176, 198), the CTDO₂ dissolved-oxygen data from the mixed layer, especially near the ocean surface, is questionable. The data are considered to be questionable because the upcast dissolved-oxygens and the water bottle data do not confirm the presence of an extremely high dissolved-oxygen layer near the ocean surface.

The CTDO₂ data were processed in two steps. The first step consisted of identifying in the original CTDO₂ data series (Millard et al., 1978) questionable values based on a first-difference criterion and correcting position information (computer program CTDED). During the second step, calibration constants were applied, and the original data series was pressure-sorted to a uniform 2 dbar series and salinities and dissolved-oxygens computed.

Instead of correcting the temperature data for the difference in the time response of the conductivity and temperature sensors, the conductivity data were filtered to equalize the responses of the two sensors (Millard, 1981). The conductivity was filtered with a standard recursive filter assuming a time constant of .24 seconds (Bendat and Piersol, 1971). In addition, conductivity Cox numbers (Georgi and Millard, 1981) were calculated to summarize the high wavenumber (>.5 cycles/dbar) information.

DISSOLVED-OXYGEN RESIDUALS

Figure 4: CTD#8 dissolved-oxygen residuals. Samples from the upper 100 dbars have not been used. The standard deviation of the residuals for the 927 samples is 2.1% , $\sim .1$ mL/L.

DISSOLVED-OXYGEN RESIDUALS

Figure 5: CTD#3 dissolved-oxygen residuals. Samples from the upper 100 dbars have not been used. The standard deviation of the residuals for the 416 samples is 6.4%, $\sim .3$ ml/l.

3. EXPLANATION OF CTDO₂ DATA PRESENTATION

For each station a graphical and a tabular presentation are given. The tabulated data include both station position information and observed and derived CTDO₂ data at standard pressure levels. The sonic depth, in corrected meters, was read from a shipboard depth recorder at the start of each station. Date (day/month/year) and time are reported in Coordinate Universal Time (GMT).

The primary CTDO₂ data are presented on the left of each page and derived quantities on the right. Definitions and units are given in Table I. Shown on the page opposite the listings for each CTDO₂ station are the vertical profiles of temperature (TE), salinity (SA), dissolved-oxygen (O₂), and the bottle data.

TABLE I

Explanation of CTD0₂ Data Listings

<u>Column Heading</u>	<u>Explanation</u>
PR	Standard level pressure in dbars (100 dbars = 1MPa).
T	In situ temperature, degree C (1968 International Practical Temperature Scale).
S	Salinity, in parts per thousand (‰) (according to the 1978 Practical Salinity Scale; Lewis, 1980).
θ	Potential temperature (Fofonoff, 1977).
Sig- θ , Sig-1, Sig-2, Sig-3, Sig-4	Anomaly of potential density, kg/m ³ , relative to 0, 1000, 2000, 3000, 4000 dbar.
HGTH	Geopotential in 10 Joule/kg, (or dynamic height in dynamic meters).
N	Brunt-Väisälä frequency in cycles per hour. Derivatives have been calculated with a least-squared algorithm using data from one-half the listing interval above and below the standard level.
DE	Depth in meters (Saunders and Fofonoff, 1976).

4. ACKNOWLEDGEMENTS

This work was supported by funding from the National Science Foundation - Office of International Decade of Ocean Exploration (NSF Grant OCE-78-22223 to the Woods Hole Oceanographic Institution).

We gratefully acknowledge the cooperation of Argentine Servicio de Hidrografía Naval and the Instituto Antártico in Buenos Aires and the assistance of the officers of the R/V ATLANTIS II; and finally, we wish to express our gratitude to the crew of the R/V ATLANTIS II whose cooperation and good spirits contributed so significantly to the success of the cruise.

The data processing was aided by numerous computer programs developed by current and former members of the Woods Hole Oceanographic community: MLTRG, Nick Fofonoff; ROSEY, John Toole; PRSORT, Edward Horne and Bob Millard; CTD utility programs, Mary Hunt; and plotting programs, Roger Goldsmith.

REPORT DOCUMENTATION PAGE		1. REPORT NO. WHOI-81-71	2.	3. Recipient's Accession No.
4. Title and Subtitle PRESSURE, TEMPERATURE, SALINITY AND DISSOLVED-OXYGEN PROFILE DATA FROM R/V ATLANTIS II CRUISE 107 - LEG X				5. Report Date August 1981
7. Author(s) Daniel T. Georgi, Alberto R. Piola and Nancy Galbraith				6.
9. Performing Organization Name and Address Woods Hole Oceanographic Institution Woods Hole, MA 02543				8. Performing Organization Rept. No.
12. Sponsoring Organization Name and Address National Science Foundation- Office of International Decade of Ocean Exploration				10. Project/Task/Work Unit No.
				11. Contract(C) or Grant(G) No. (C) (G) OCE 78-22223
				13. Type of Report & Period Covered Technical
15. Supplementary Notes This report should be cited as: Woods Hole Oceanog. Inst. Tech. Rept. WHOI-81-71.				14.
16. Abstract (Limit: 200 words) This report summarizes in graphical and tabular form the continuous conductivity-temperature-pressure-dissolved-oxygen (CTDO ₂) data collected during the R/V ATLANTIS II cruise 107, Leg X. These data were collected in the austral winter of 1980 as part of the International Southern Ocean Studies (ISOS) to evaluate and test various Antarctic Intermediate Water formation and circulation mechanisms.				
17. Document Analysis a. Descriptors 1. Southwestern South Atlantic 2. ISOS 3. Antarctic Intermediate Water (AAIW) b. Identifiers/Open-Ended Terms c. COSATI Field/Group				
18. Availability Statement		19. Security Class (This Report) Unclassified		21. No. of Pages 185
		20. Security Class (This Page)		22. Price
